

DYNAMO

THE LATEST IN FODDER BEET GENETICS

Dynamo is a recently bred, low dry matter mono-germ fodder beet variety released to the New Zealand market for the first time this year. Proven throughout New Zealand in a range of on-farm trials, Dynamo represents the newest genetics available in fodder beet breeding with very good disease and bolting tolerance.

Dynamo has a soft fleshed bulb with an average dry matter of 12-14% and is easily grazed by animals of all ages due to its large protruding red bulb that sits 60%+ out of the ground.

Agronomic traits

- Bulb percentage above ground: +/- 60%
- Dry matter percentage: 12-14% *
- Bolting tolerance: Very good *
- Disease tolerance: Very good *
- Maturity (days to graze): 200+
- Sowing season: spring
- Sowing rate (seeds/ha): 80,000 - 100,000

*Subject to climate, insect pest pressure and management

Benefits

- Easily grazed by stock due to the majority of the bulb sitting higher above ground
- Suitable for all livestock types but especially suited to sheep and young stock
- Seed is pelletised with world leading technology and coated with insecticide and/or fungicide only options
- Available in handy 50,000 seed boxes

Proven throughout New Zealand in a range of on-farm trials. A high quality winter feed, with low dry matter content, capable of producing high volumes for grazing by stock of all ages.
