

KOKOMO

THE NEW BEET ON THE BLOCK

Kokomo is a new mono-germ fodder beet variety available to the New Zealand market this season which has a similar breeding background/parentage to Dynamo but with a slightly higher bulb dry matter percentage range of 14-16%.

Kokomo has a large red tankard shaped bulb that sits approximately 50%+ above the ground with good disease and bolting tolerance. The crop can be grazed in-situ by all stock types.

Agronomic traits

- Bulb percentage above ground: +/- 50%
- Dry matter percentage: 14-16% *
- Bolting tolerance: Very good *
- Disease tolerance: Very good *
- Maturity (days to graze): 200+
- Sowing season: spring
- Sowing rate (seeds/ha): 80,000 - 100,000

*Subject to climate, insect pest pressure and management

Benefits

- Latest fodder beet genetics available
- Consistently high yielding in all on-farm trials to date
- Large top growth
- Seed is pelletised with world leading technology and coated with insecticide and/or fungicide only options
- Available in handy 50,000 seed boxes

A high quality winter feed, with low to medium dry matter content, capable of producing high volumes for feeding in situ.
